

Finally Hair Building Fibers: Hair Loss Concealer

Hair loss, commonly known as balding or balding spots, is a common occurrence in both men and women, although men are more vulnerable to it, mainly because of male pattern baldness (androgenic alopecia). People of all ages can face this problem, especially people well over their 40's. While hair loss relates to all body hair, it is more common and problematic when it concerns the hair loss from the head.

Hair loss can either be mild, only thinning out your hair or it can be extreme, making bald spots in your head or generally being very noticeable. Either way, it is awfully distressing, as our hair makes up a prominent part of our overall appearance. Especially when you are middle aged, well into life, hair loss is a hassle to deal with.

On an average people's head full of hair usually counts between 100,000 or 150,000 – this is of course a rough estimate and people's hair count can vary but whatever it may be, the average amount of hair that falls every day should be 100 or less. Of course, you do not count how much hair you lose everyday but the main and first signs of hair loss or balding is when you start to lose more hair than you replace. Seeing more hair come out when you brush it, seeing extreme amounts of hair stuck in the brush, or noticing wider partings or thinning crown area, are all signs of advancing or occurring hair loss.

You may wonder what the reason behind hair loss may be but the fact is, there is not just one reason behind balding or thinning hair. There are many causes of hair loss, such as:

Male Pattern Baldness: MPB is the main cause of hair loss in men, being the cause 95% of the times. Male Pattern Baldness is recognized in men when their hair recedes from lateral sides of their foreheads, which is also termed as having a receding hairline. The crown area also thins out and when both, the receding hairline and thinning crown, meet, they become very noticeable. While it isn't completely identified, it is generally thought to be an occurrence because of many genetic causes.

Diet & Nutrition: Various studies have indicated that our diet can play a role when it comes hair loss. Poor or lack of proper food intake and deficiency of some nutrients cause hair loss. Lack of biotin, protein, zinc, etc. can cause loss of hair and can eating junk food a lot or taking a diet loaded with animal fats.

Medications & Drugs: People who take medications for blood pressure, diabetes, heart problems, cholesterol, etc. can suffer from temporary or permanent hair loss. Apart from that, taking birth control

pills, steroids, and any other medicines that affect the body's hormones are known to cause hair loss. Chemotherapy is the main cause of hair loss for those who have cancer.

Infection: Many infections can also cause hair loss, such as dissecting cellulitis, folliculitis, secondary syphilis, and some fungal infections.

There are many other causes of hair loss as well such as traumas, pregnancy, air and water pollutants, hypothyroidism, etc. but whatever the cause may be, most of them tend to have a **psychological effect** on the sufferers. The psychological effect is mainly stress induced because of their general appearance, but it is a very complex matter in itself.

People consider their hair to be a vital factor in their overall appearance and even identity. Women especially are affected with stress because they believe hair represents their femininity and increases their attractiveness. But that doesn't mean men are not affected – some men take it worse than women because they think of their hair as a representation of youth and life. Often there are men who are entirely uncomfortable about discussing the issue, even if hair loss is common in their family. It can easily be assumed that both the sexes take hair loss roughly and negatively.

Curing Hair Loss

Many people go for extreme measures to regain their hair such as hair transplants, which is common amongst men. However, all such extensive procedures are expensive, complex, and not entirely safe to opt for. This is where Finally Hair's Hair Loss Concealer Applicator comes in. This is an easy, effective, inexpensive, and best of all, instant solution to transform your balding head into a head full of hair.

Hair Loss Concealer actually consists of hair building fibers that instantly work to cover hair loss, balding or thinning spots, alopecia, and other hair loss characteristics instantly. The hair building fibers in this solution are protein-based keratin micro fibers which are designed to match your hair color and instantly cover all balding spots, giving you back your full and young appearance once again.

For both the genders, this solution is easy and usable. The solution contains no drugs or harsh chemicals, which is why it is a 100% safe formula to use, with no side effects, no matter what age you may be. The solution instantly puts hair on your head and prevents the very hair loss that made you psychologically distressed about your appearance.

Using the solution is very easy as well, and the after result is amazing. You have a head full of hair, looks completely real, matches your hair color, does not itch or irritate in any way and doesn't fall out either. All you have to do is wash and dry your hair and style it as you want to and then sprinkle the Hair Finally solution on the areas that are balding or thinning. Using mild hair spray you can set the solution as well as your hair and you're good to go. Easy, instant, safe, and cheap, recovering from hair loss has never been easier.
